What is hack recovery?

Hack recovery is a multi-stage process for restoring a site, application or server back to working condition. It is also ascertaining the impact of damage and the retrieval of stolen data. A hack recovery specialist is needed to initiate the restoration process after you've been subject to an attack. Recovery varies depending upon the attack; issues can range from system abuse to stolen data.

We can facilitate recovery from a range of attack mechanisms including:

- Collection and analyzation of information
- System functionality abuse
- System structure manipulation
- Data manipulation
- Subversion of access control
- Injection of items into your system

A hacker may conduct footprinting to obtain your information in preparation of a system hack. Even footprinting can have a negative effect, it is often a prequel to damaging attacks and sensitive data may be obtained. Fortunately, we can recover your system and data if it has been subject to a hack. Recovery is essentially the closure of any open doors used to compromise your information and system.

Why do you need hack recovery?

Hack recovery allows you to regain control of the site or web application that's been hacked. If you believe your site has been destroyed or your data is lost, you've been hacked. Malicious bots and individuals exploit sites, retrieve private information, delete files and more. Hack recovery resolves these among many other issues. Hack recovery is also necessary to determine the severity of the attack and recover data.

When it comes to online sites, businesses can suffer from not removing infected files. Exploited sites are blocked from search results and even financial institutions can be

alerted to protect users from your site. If you've been hacked, you'll want to avoid being blacklisted by browsers, search engines, and directories as a spam. The problem worsens due to inaction. By acting quickly and initiating the recovery process, your site can avoid being blacklisted. Inaction subsequent to an attack could unnecessarily expose private information such as financial data of you and your clients.

Here are a few situations where you would need a hack recovery specialist to successfully:

- Re-install Wordpress after a hack
- Clean an .hta access attack
- Clean an injection of code

What we offer?

A malicious hack can cause a website to go down, causing unnecessary downtime and potential loss of revenue. Our hack recovery services will help you or your business regain full site control, data recovery, and re-assume security of your data. We can clear your site from blacklists and untrusted site notices in order to avoid issues with search engine rankings. We can assist you with any attack on your site whether you utilize Wordpress, Joomla, Magento, Drupal, OSCommerce, ExpressionEngine or a customized site. Our services also cover attacks on your server, regardless of type.

Our hack recovery services are offered in three main components:

1. Hack identification
2. Hack removal
3. Post-hack security

Our software monitors your site 24/7 for failed login attempts, recording the uploading of files, altered content, and more. We thoroughly scan the files of your site for malicious code, identifying negatively affected files and removing them. All infected files on your site will be removed and replaced with clean files with the addition of administrative back end site protection.

Essentially, our work prevents any possibility of hacker re-entry to your site through open backdoors. We're proud to say that we've helped hundreds of businesses stay in operation after a hack. Regardless of your setup, server type or cause of failure, our services are indispensable to recovering from a hack. In some cases, the hack may occur on your server or for the purpose of gaining access to your web application.

Here is a short list of servers types we can recover:

- Linux Recovery
- Virtual Machine Recovery
- Database Recovery
- Buffalo Terastation Recovery
- UNIX Recovery
- NAS Data Recovery
- Mac Recovery
- Windows Recovery
- SAN Data Recovery

We can restore the damages done after a hacker accesses your management console or any other interface that you manage from. When it comes to web applications, multiple components can become hacked. The hacker may go after the client-side controls of the web application, components of the back end, and the authentication area.

The hack recovery activities can be quite granular and vary upon the situation. Your hack recovery service includes:

- Professional cleaning of site files
- Professional server cleaning
- Selective removal of hacker created URLs
- Safe restoration of content and data
- Enhanced security to safeguard against future attacks
